

EE 597 Final Project / Research Paper Rubric

Total: 100 points

This rubric is intended to evaluate both the technical quality of the project and the credibility of the submission as a miniature research paper. *A full 20% of the grade is based on the quality of the writeup and whether it reads as a credible research paper rather than just an informal project report.*

1. Problem Formulation and Motivation — 10 pts

How clearly the paper identifies the problem, explains why it matters, and situates it within wireless networks.

- 9–10: Clear, well-motivated, focused problem with strong relevance
- 7–8: Problem is clear but could be sharper or better motivated
- 5–6: Somewhat vague, broad, or weakly motivated
- 0–4: Poorly formulated or unclear problem

2. Technical Approach / Design — 20 pts

Quality of the protocol, model, system design, or research methodology.

- 18–20: Strong, well-justified technical approach with thoughtful design choices
- 14–17: Sound overall approach with some missing justification or depth
- 10–13: Basic but reasonable approach
- 0–9: Weak, unclear, or poorly justified approach

3. Implementation / Simulation Quality — 20 pts

Quality of implementation and realism/appropriateness of simulation setup.

- 18–20: Careful, complete implementation; simulation setup is appropriate and convincing
- 14–17: Mostly solid implementation with minor limitations
- 10–13: Partial or basic implementation; limited simulation depth
- 0–9: Minimal or unreliable implementation/simulation effort

4. Evaluation and Experimental Methodology — 20 pts

Quality of evaluation, use of metrics, baselines, scenarios, and interpretation of results.

- 18–20: Strong evaluation with meaningful metrics, well-chosen scenarios, and relevant baselines
- 14–17: Good evaluation, though somewhat limited in breadth or depth
- 10–13: Basic evaluation with modest insight
- 0–9: Weak or insufficient evaluation

5. Writeup Quality and Research Credibility — 20 pts

How credible the submission is as a miniature research paper, not just a project report.

- This includes organization and clarity, proper IEEE-style structure, quality of related work/background, soundness of claims, honesty about limitations, alignment between claims, evidence, and conclusions, and professionalism of figures, tables, and presentation.

- 18–20: Reads as a credible research paper; clear structure, appropriate framing, careful claims, good use of evidence, limitations acknowledged
- 14–17: Solid writeup with good structure and mostly credible argumentation, but some weaknesses in framing, citations, or claim discipline
- 10–13: Understandable writeup, but more like a project report than a research paper; limited context, overclaims, or weak discussion
- 0–9: Poorly organized, weakly supported, or not credible as a research-style paper

6. Reproducibility / Public Repo Quality — 5 pts

Public GitHub repo with code, data, and enough documentation to inspect or rerun the work.

- 5: Clean, complete, documented, and reproducible
- 3–4: Repo exists and is mostly usable
- 1–2: Repo incomplete or poorly documented
- 0: Missing or unusable

7. Originality / Ambition — 5 pts

Scope, creativity, and degree of challenge undertaken.

- 5: Ambitious and/or notably original
- 3–4: Some originality or thoughtful extension
- 1–2: Reasonable but fairly standard
- 0: Minimal effort or ambition

One-line Summary Version

Category	Points
Problem formulation and motivation	10
Technical approach/design	20
Implementation/simulation quality	20
Evaluation and experimental methodology	20
Writeup quality and research credibility	20
Reproducibility/public repo	5
Originality/ambition	5
